Using our fine-tuned model

Fine-tuning is a powerful technique to create a new model that's specific to your use case. Before fine-tuning your model, we strongly recommend reading these best practices and specific guidelines for your use case.

After creating our new model after our success message it should generate a message saying try out your model. Insert the fine-tuned model command we copied from the previous page. it should look like the commnad below. Use "Codio sign: its tuesday ->" for your prompt.
Run it in the terminal:

openai api completions.create -m <FINE_TUNED_MODEL> -p <YOUR_PROMPT>

In order to generate output with Python you can try the following using your model in the openai.Completion.create() function in the tester.py file opened in the upper-left panel:
python3:

model= "curie:ft-personal-....",
prompt="Codio sign: its tuesday ->"

TRY IT!

After you've fine-tuned a model, remember that your prompt has to end with the indicator string -> for the model to start generating completions, rather than continuing with the prompt.

Play around with a couple of prompts. Please note that while playing around the AI can generate different answers every run. Additionally, you can play around with some of these as extra arguments like temperature | top_p | max_tokens .

When ready we can go over deleting our model. In case you no longer want to interact with a model you created you can run the following code to remove it.

Run it in the terminal:

openai api models.delete -i <FINE_TUNED_MODEL>

After your fine-tuned model is deleted you can see something similar in the terminal:

{
 "deleted": true,
 "id": "curie:ft-personal-2023-06-02-10-48-12",
 "object": "model"
}

Or do it in python3:

import openai
openai.Model.delete(FINE_TUNED_MODEL)

TRY IT!

Fill in the blank with the right symbol to make the statement true.

Remember that the prompt has to end with the indicator string -> for the model to start generating completions.

Keep in mind, after fine-tuning a model, ensure that your prompt concludes with the signal string -> . This is necessary for triggering the model to commence completion generation, as opposed to extending the prompt further.

Check It!
