Coding Exercise

Write a function called `generate_response` that takes a prompt and model as input and returns the generated response using the `openai.Completion.create method`. The function should have the following signature:

```
def generate_response(prompt, model):
    #your code should be below this line
    return response.choices[0].text.strip()
```

TRY IT!

Command was successfully executed.

Function API call

When you are done testing your code, please use the button below to submit your code

```
def generate_response(prompt, model):
    response = openai.Completion.create(
        engine=model,
        prompt=prompt,
        max_tokens=100,
        n=1,
        stop=None,
        temperature=0.7,
    )

    return response.choices[0].text.strip()
```

Here learners are only instructed to give a working code model. Variables such as `temperature` and `n` are not needed to get the function working. `response = openai.Completion.create(...)` This line is where the API call to OpenAI is made. This function call is creating a "completion", which is an extended piece of text that continues from the prompt.The learner should just have both the prompt and the model given as function arguments pointing towards the right function arguments.
