```

Coding Exercise

MoreFlix

Rearrange the code below so that our Moreflix function is expanded and can handle recommendations that are not movies. (Hint: Indentation matters)

def Moreflix():

ask the user for different inputs

user_req=input("what recomendation type do you want? book ?song? movies? show? ")

number_recs=input('How many '+user_req+' do you want recommended: ')

genre=input('What genre are you looking for: ')

similar=input('What is a similar ' + user_req + ': ')

if number_recs=="0":

number_recs=5

if genre=="0" and similar=="0":

return("In a python list form, give me " + str(number_recs) + user_req + "recommendation")

if genre=="0" :

return ("In a python list form, give me " +str(number_recs) + user_req + "recommendation, similar to " + similar)

if similar=="0":

return ("In a python list form, give me "+ str(number_recs)+ " " + genre + user_req + " recommendation")

return ("In a python list form, give me "+str(number_recs)+" "+genre + user_req +" recommendation similar to " + similar)

We simply added a new variable called `user_req` and passed that instead of movies in our prompt when generating a response.

Check It!
