

Summary of this week

- How is the boot camp going? Are you getting stronger?
- This week, you learned a lot of new concepts regarding state-space models of dynamic systems.
 - You learned how they are defined, both for continuous-time and discrete-time systems.
 - You learned NCP, NCV, and CT example models that are useful for tracking.
 - You learned how to understand and simulate dynamic response.
 - You learned how to convert from a continuous-time to a discrete-time model.
 - You learned how to determine whether the system is observable, and why that matters.

Where to from here?

- There remains one significant topic area to this boot camp.
- How do we think about randomness? How do we quantify something that we don't know?
- This is critical to being able to describe the uncertainty of the process and sensor noises that are input signals to our state-space models.
- It's also critical to being able to understand the output of the KF, since the KF presents its state estimate and confidence bounds in a probabilistic sense.
- Next week, you will learn about random processes and how these are used to describe the inputs and outputs of KF.
