1. What is the strategy presented in this lesson for implementing a Kalman filter for prediction?

1 / 1 point
- ☐

Start with the output of a standard Kalman filter and add steps to provide an estimate of the states of the system at a past time.
- ☐
- Simulate possible future state trajectories via random selection of
- w_k
- and
- v_k
- and average results to produce the state prediction.

☒☐

✔ Correct
Yes. That is correct.

2. Which of the following is true for the results presented in this lesson?

1 / 1 point
- ☒
- Error bounds on predicted states are greater than those for estimated states.

☐☐☐

✔ Correct
Yes. This is correct.

3. Execute the Coursera Labs Jupyter notebook for this lesson. Use `M=6` to predict six timesteps into the future and also set `useU=0` to force the filter not to use future values of `u` when predicting the future state.

1 / 1 point

What is the percentage of time that the predicted position error is outside of the confidence bounds? Enter your answer with one digit to the right of the decimal point.

0.5

✔ Correct
Yes. That is correct.
