1. Run the IMM code in the Coursera Labs Jupyter notebook for this lesson. What does the IMM identify as the most likely target mode at time $t = 150$ seconds?

1 / 1 point

- ☒ The NCP mode.
- ☐ The NCV mode.

✔ Correct

Yes. That is correct.

2. When executing the IMM code in the Coursera Labs Jupyter notebook for this lesson, what is the fraction of time that the error is outside of the confidence bounds? Enter your answer with one digit to the right of the decimal point.

1 / 1 point

0

✔ Correct

Yes. That is correct.

3. Which of the following is true regarding the results obtained when running the IMM in the Coursera Labs Jupyter notebook for this lesson?

1 / 1 point

- ☐ The error bounds of the estimate are basically the same width when the target is operating in NCP and NCV modes.
- ☐ It is not possible to know whether the error bounds are tighter when operating in one mode versus the other.
- ☒ The error bounds of the estimate are tighter when the target is operating in NCP mode.
- ☐ The error bounds of the estimate are tighter when the target is operating in NCV mode.

✔ Correct

Yes, this is correct. The target is less mobile so it is easier to be more certain of its position.
