1. Which of these is the best definition of “Generative AI”?

1 / 1 point

- ☐ A form of web search
- ☐ Any web-based application that generates text
- ☐ Artificial intelligence systems that can map from an input A to an output B.
- ☒ AI that can produce high quality content, such as text, images, and audio.

✔ Correct

Generative AI refers to a collection of tools that can generate high quality text, images, video, and audio.

2. A computer vision system “sees” objects in the same way that a living creature does.

1 / 1 point

- ☐ True
- ☒ False

✔ Correct

Computer vision systems work with pixel-level data, which is a series of numbers, and so do not “see” in the same way as living creatures, which recognize aggregate features or objects all at once.

3. How does machine learning differ from traditional programming paradigms?

1 / 1 point

- ☒ Machine learning derives rules from data and known answers, rather than explicitly coding rules.
- ☐ Machine learning requires determining complex sets of rules before writing any computer programs
- ☐ Machine learning doesn't require any input data, while traditional programming always uses data
- ☐ Machine learning uses robots to write code instead of human programmers.

✔ Correct

Traditional programming involves expressing rules in code to act on data and get answers. In contrast, machine learning reverses this process by using data and answers to derive the rules.

4. Machine learning is an iterative process. Which of the following are steps that you'll carry out during a machine learning project? Select all correct answers.

1 / 1 point

- ☐ If your data is labeled, remove the labels to ensure that information does not affect the process of training the model
- ☒ Write a program that makes an initial guess about the nature of the relationship between the data and their labels

✔ Correct

The first step in the machine learning paradigm presented by Laurence is to take a first guess at the relationship between the data and their labels.

- ☒ Optimize your guess by learning from examples where the model could not predict the label of the input data

✔ Correct

Learning from the mistakes made by the machine learning model and iteratively improving the model's performance over time is a key step in a machine learning project.

- ☐ Provide the machine learning model with explicit rules that it should use to make predictions

5. Which of the following day-to-day software development tools have some Generative AI integrations powering them? Select all correct answers.

1 / 1 point

- ☒ Search engines

✔ Correct

Many search engines are now using Generative AI tools to provide summaries of search results.

- ☒ Integrated Development Environments (IDEs)

✔ Correct

Many IDEs now support LLM-powered code completion tools, including VSCode, JetBrains, Neovim, and others.

- ☒ Image and game asset editors

✔ Correct

Many tools for editing images or game assets now include tools to help generate these assets using generative AI.

- ☒ Debugging tools

✔ Correct

Several tools exist for debugging code using an LLM, including Github Copilot
